

Cyber Defence GRC Tool

Project Description

The **Cyber Defence GRC Tool** is a web-based cybersecurity application designed to support **Governance, Risk, and Compliance (GRC)** activities within an organization such as a college or educational institution.

The tool provides a simple dashboard for identifying and managing information technology assets and cybersecurity risks. It helps users record organizational assets, identify potential threats, calculate risk scores based on likelihood and impact, and classify risks according to their severity.

Key Features

1. Asset Management

The Asset Management module allows users to record and manage important organizational assets, such as:

- College Servers
- Student Databases
- Examination Servers
- College Websites
- Wi-Fi Networks
- Faculty Laptops
- Library Management Systems
- Backup Servers

Each asset can be recorded with its name and asset type.

2. Risk Management

The Risk Management module allows users to identify cybersecurity risks associated with organizational assets.

Users provide:

- Risk name
- Likelihood rating from 1–5
- Impact rating from 1–5

The system calculates the risk score using:

Risk Score = Likelihood × Impact

3. Risk Classification

Based on the calculated score, risks are classified into different severity levels:

Score	Risk Level
1–4	Low
5–9	Medium
10–16	High
17–25	Critical

This allows users to quickly identify high-priority cybersecurity risks.

4. Dashboard

The dashboard provides an overview of the organization's security posture, including:

- Total number of assets
- Total number of identified risks
- Number of high and critical risks

This gives administrators a quick view of the current risk situation.

Example

For a college environment:

Asset: College Student Database

Risk: Unauthorized access to student records

Likelihood: 4

Impact: 5

Therefore:

Risk Score = $4 \times 5 = 20$

The risk is classified as:

Critical

Technologies Used

The current version of the tool is developed using:

- **HTML** — Web page structure

- **CSS** — User interface and styling
- **JavaScript** — Risk calculation and application functionality
- **GitHub Pages** — Web hosting/deployment

Objective

The primary objective of the Cyber Defence GRC Tool is to provide a simple and user-friendly platform for demonstrating fundamental cybersecurity governance and risk-management processes.

The project can be further expanded with:

- Compliance management
- Security controls
- Audit management
- Risk treatment
- User authentication
- Database integration
- PDF report generation
- Risk charts and analytics
- Security frameworks such as ISO 27001 and NIST

Project Status

Current Version: Initial Prototype

The current prototype focuses on **Asset Management and Risk Management**. Future versions can extend the platform into a complete GRC solution.

Repository

The source code for this project contains the HTML, CSS, and JavaScript files required to run the Cyber Defence GRC Tool.
